GAUNTLET REPORT · PALIFY

eClau v6

10,080 simulated games against Top 20 meta decks, piloted by the live champion bot. What the deck does, why it loses.

10,080 games Quick Run · 1 round pilot forge-2 · temp 0.4 2026-10-13

AS WRITTEN	UNWEIGHTED	GAMES	MEDIAN GAME	GOING FIRST
59.78% weighted by how often you meet each deck	**63.16%** every opponent counted equally	**10,080** 1 independent round	**7 turns**	**+33.6 pts** 80.0% on the play vs 46.4%

The short version

The deck wins **59.8%** of games against Top 20 meta decks, weighted by how often you meet each deck. Its worst matchup is **Cattiva + Pengullet** at 32.1% — 679 real games on the ladder; its best is Foxparks + Foxparks at 89.5%.

It is **33.6 points better going first** (80.0% on the play against 46.4% on the draw). If you win the roll, take it.

61% of its losses are genuine races that came up short — the deck gets there and loses the coin flip. Those are the games a small edge flips.

THE FIELD

What it was tested against

The 20 opponents were rebuilt from the site database the day of the run — finished ladder games clustered by card overlap into archetypes, ranked by how often they are actually played. Together they account for **54,892 real games**. Each was fought **504 times**, seats alternating, both sides piloted by the same bot at the temperature it uses against real players.

THE VERDICT

Every matchup

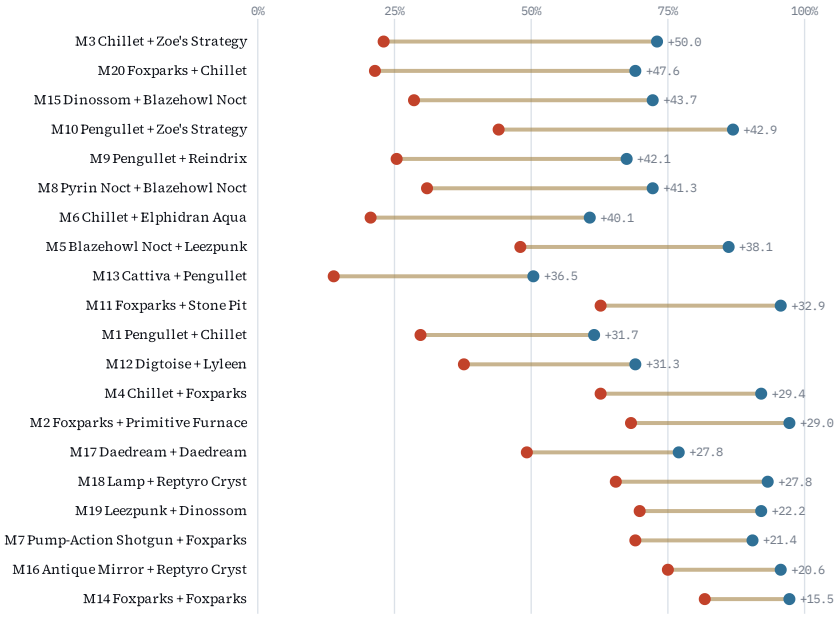

Sorted worst to best. The meta column is how often you would actually meet each deck — a bad matchup against a popular deck costs more than a worse one against a rare deck.

OPPONENT	WINRATE	95% CI	ON PLAY	ON DRAW	MED. TURNS	META GAMES
M13 Cattiva + Pengullet	32.1%	28.2–36.3	50%	14%	6	679

> **Going first is worth 33.6 points.** 80.0% on the play against 46.4% on the draw, over 5,040 games each.

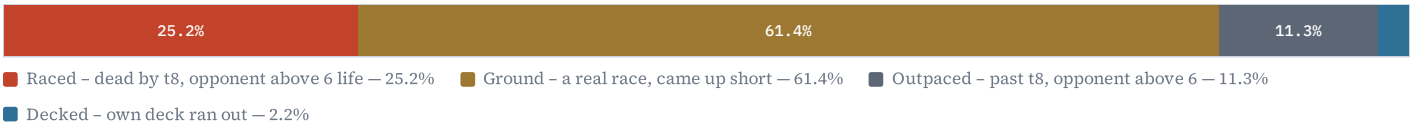

On the play versus on the draw, every opponent

● on the play ● on the draw. The bar between them is what the coin flip is worth in that matchup.

DIAGNOSIS

How it loses

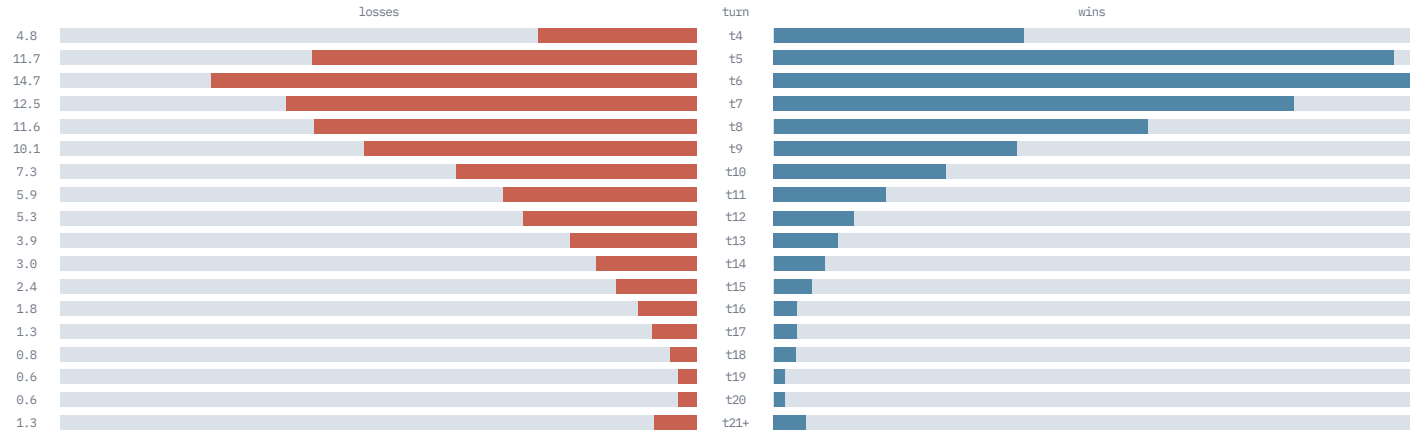

36.4% of losses end with the opponent still above six life; **61.4%** are genuine races that came up short.

How it loses, opponent by opponent

Same four kinds, as a share of that matchup's losses. A deck that is *raced* by one opponent and *ground down* by another needs two different answers.

OPPONENT	WINRATE	LOSSES	RACED	GROUND	OUTPACED	DECKED	MED. W/L
M13 Cattiva + Pengullet	32.1%		51%	45%	4%	0%	6/6

Game length — wins versus losses

Losses outnumber wins at every game length.

Life totals through the game

Both sides' life at the end of turns 3, 5, 7, 10, averaged over wins and over losses. The gap between the two dashed lines is how much the deck actually hurts the opponent; the gap between the two solid ones is how much it is hurt.

How much the deck got to do

A deck that loses while making fewer plays has a resource problem; one that loses making the same number has a card-choice problem.

PLAYS PER GAME	PALS DEPLOYED	STRUCTURES	GEAR	EVENTS	INTERRUPTS	TOTAL
in wins	7.71	0.00	1.21	0.25	3.31	12.47
in losses	7.55	0.00	1.90	0.38	5.97	15.80
difference	+0.16	0.00	-0.70	-0.13	-2.66	

THE PILOT

Played the other ways

Your line, **However it plays best**, was measured across the whole census — 10,080 games. Each alternate was given 1,500, which is an *overall* figure and nothing finer: at that size a single matchup carries roughly 11 points of error, so none of these numbers is quoted per matchup and none should be read that way.

LINE	WINRATE	GAMES	VS YOURS	NOISE	
However it plays best yours	63.16%	10,080	–	±0.9	
Board first	65.80%	1,500	+2.64	±2.6	clears the noise
Patiently	63.27%	1,500	+0.10	±2.6	inside the noise
Aggressively	62.40%	1,500	-0.76	±2.6	inside the noise
Set up, then go	60.87%	1,500	-2.30	±2.6	inside the noise

> **Played Board first this deck wins +2.6 points.** That gap is bigger than the error on both measurements together (±2.6), so it is a real difference in how the list wants to be piloted — not a coin landing. It is worth a run of its own at full scale before you rebuild around it.

CARD BY CARD

Every card, scored inside its game-length band

Two different questions, side by side. **Drawn** is the winrate when the card was in hand at all minus when it never was — the shuffle decides that, not the pilot, so it is the fair test of whether a card earns its slot. **Played early** is the winrate when it hit the table by turn four minus when it never did — a test of *tempo*, and a bad one for a card meant to be held. Both are measured inside each game-length band so long games cannot inflate everything equally. The table ranks by drawn lift. Stranded is copies still in hand at the end, per game.

CARD	COPIES	COST	DRAWN — LIFT BY BAND				PLAYED EARLY — LIFT BY BAND				STRANDED
			T4–6	T7–9	T10–14	T15+	T4–6	T7–9	T10–14	T15+

Kitsun – Wyrmbane Fangs	4x	◇5	-2.7	+0.2	–	–	-6.2	-10.6	-14.5	–	0.52
Axel's Strategy	2x	◇4	-3.7	-1.9	+1.8	–	-4.6	–	–	–	0.34
Pump-Action Shotgun reactive	4x	◇7	-13.4	-12.7	–	–	-46.5	-30.0	–	–	0.31

Read the reactive cards with care. Blazehowl – Hellflame Defender, Pump-Action Shotgun, Foxparks, Single-Shot Rifle, Reindrix – Icy Gaze are played when the moment comes — a Quick held for the right attack, gear rested on demand, a trap sprung later — so "not played by turn four" includes every game where the moment had not arrived. Their *played early* numbers say nothing about whether they are good cards; only the *drawn* column does. A negative *drawn* number in the t4–6 band means the card was a costly *early* draw — a trick or a payoff in a hand that needed a body — which is a fact about the opening, not a verdict on the card. And every number here is under one pilot: a line the bot does not know — targeting your own Pal to re-trigger it, sacrificing a structure on purpose — is not measured at all, and a card whose value is that line will be undersold.

Jormuntide leads the *played early* column at +18.5 — and at ◇8 it cannot be deployed by turn four. What that measures is the card being **discarded as a cost**: the "and 1 other card" half of an Interrupt, most often. The deck's early defence is its Interrupts, and the expensive cards in hand are what pays for them — which is a reason to keep them, not to cut them.

Drawn, played, and when

For each card: how often it was drawn and how often it was actually played, in wins versus losses, and the average turn it first hit the

table. A card played *later* in wins than in losses is one the deck does better holding.

CARD	COPIES	DRAWN W / L	PLAYED W / L	TURN W / L	GAP	STRANDED
Cattiva – My First Pal ◇2	4x	80 / 81	67 / 67	3.13 / 3.55	+0.42	0.34

DECK RESEARCH

The openings that decide it

Every condition here is sealed by turn 5, which is the point of it: a fact you can read off the board while there are still decisions left to make. **Winrate** is the games that met the condition, **without** the games that did not, and **banded** is the same gap measured inside each game-length band and pooled — because games you win run longer, so any "played it late" condition looks like a virtue until length is held still. **Field** is how many of the 18 opponents saw it the same way, and it is the number to trust most: a gap that holds against every deck in the field is not an artifact of whichever matchup contributed the most games.

CONDITION, BY THE END OF TURN 5	WINRATE	WITHOUT	GAP	BANDED	FIELD AGREES	GAMES
Pump-Action Shotgun down by turn 3	30.2%	66.6%	-36.4	−36.5	18/18	941
No gear down by turn 4	74.6%	47.8%	+26.8	+25.7	20/20	5,755
Two or more Pals down by turn 3	63.8%	48.2%	+15.6	+18.3	2/2	9,672
Reindrix down by turn 2	49.7%	64.5%	-14.8	−14.7	14/15	914
Jormuntide down by turn 4	72.7%	58.0%	+14.6	+13.8	20/20	3,525
Single-Shot Rifle down by turn 3	49.0%	64.4%	-15.4	−13.5	16/17	800
Kitsun down by turn 3	51.1%	63.8%	-12.8	−12.5	6/7	519
Chillet down by turn 2	53.9%	65.8%	-11.9	−11.7	19/20	2,240
Blazehowl down by turn 2	55.2%	63.4%	-8.2	−10.3	2/2	335
Elphidran Aqua still not down by turn 5	58.4%	67.9%	-9.5	−9.5	19/20	5,331
Foxparks still not down by turn 5	66.3%	57.7%	+8.6	+9.2	17/20	5,226
Pengullet down by turn 2	67.9%	60.9%	+7.1	+6.5	20/20	3,290
Axel's Strategy down by turn 4	57.4%	63.5%	-6.0	−6.1	4/5	512
Lamball down by turn 2	65.7%	62.2%	+3.5	+2.7	14/20	2,732

> **Pump-Action Shotgun down by turn 3** is the single biggest fork in the opening: 30.2% against 66.6% otherwise, −36.4 points, holding in 18 of 18 matchups and surviving the length control intact.

292 conditions were tested and 14 survived. A condition is reported only when its 95% interval clears the interval for games without it, the gap is at least 3 points both raw and length-banded, and at least 70% of the field agrees on the direction. Thresholds on the same underlying variable are collapsed to the strongest one, so "by turn 3" and "by turn 4" on one card appear once.

DECK RESEARCH

Which cards want to arrive together

A synergy claim on a deck page is usually someone's opinion. This one is a controlled comparison: **together** is the winrate when the second card landed within two turns of the first, and **apart** is the winrate when *both cards still came down inside the first five turns* — just not together. The two groups differ in one thing only, which is whether the pair arrived as the same play, so the gap between them is a statement about sequencing and nothing else.

Without that control the section is worthless, and it is worth saying why. Scored against every other game instead, any pair ending in a card the deck wants early looks like a finding — and so does every other card in the list paired with that same card, because all of them are really only saying "that card, early". One fact, printed as many times as there are cards in front of it.

SEQUENCE, WITHIN TWO TURNS	TOGETHER	APART	GAP	FIELD AGREES	GAMES
Pengullet – Yearning for the Sky then **Chillet – Dragon Whisperer**	80.7%	58.5%	+22.2	11/11	1,073 / 620
Cattiva – My First Pal then **Pump-Action Shotgun**	38.5%	59.3%	−20.8	10/10	649 / 1,113
Elphidran Aqua – Gentle Ripples then **Chillet – Dragon Whisperer**	76.9%	57.7%	+19.2	3/3	761 / 468
Pengullet – Yearning for the Sky then **Pump-Action Shotgun**	48.6%	67.0%	−18.4	6/6	1,094 / 530
Chillet – Dragon Whisperer then **Pengullet – Yearning for the Sky**	64.2%	77.7%	−13.4	17/20	939 / 1,110

> **Pengullet into Chillet** is this deck's best real combination — 80.7% when they land within two turns of each other against 58.5% when both come down early but separately, +22.2 points across 11 of 11 matchups. Holding one of them for the other is worth more than getting either onto the table sooner.

> **Cattiva into Pump-Action Shotgun** is the opposite: 38.5% together against 59.3% spread out. Both cards are fine; committing them on top of each other is what costs 20.8 points.

8 sequences passed the tests; the 5 shown are capped at two per card in either role, because a card that badly wants space makes a bad sequence with everything in front of it and would otherwise fill the table on its own.

DECK RESEARCH

When each card wants to land

The card table earlier asks whether a card earns its slot. This asks the next question, the one you have with the card already in hand: given that I drew it, when do I want it on the table. Each card's first-play turn falls into one of three **landing windows** — turn 1–2, turn 3, turn 4–5 — and each window is scored on the same game-length mix as the whole census, which is *direct standardisation* and is not optional here. Read without it almost every card in every deck appears to want holding, because the games where a card was still in hand on turn five are the long games and the long games are the won ones.

Held past turn 5 is deliberately not one of the windows, and reading it as advice is the mistake this table invites. It is the gap between games where the card stayed out of the opening entirely and games where it landed at some point — useful context, but much weaker evidence than the windows beside it. A cheap card is skipped in the

opening because the hand had something better to do, so a positive number there is substantially a fact about *hand quality*, not a decision you can copy. Treat it as a question worth asking, never as an instruction to hold the card.

CARD	COPIES	LANDING WINDOW — WHERE IT WANTS TO COME DOWN					HELD PAST T5	WANTS / AVOIDS COMPANY
		BEST	WINRATE	WORST	WINRATE	SWING		
Chillet – Dragon Whisperer ◇5	4x	**turn 3**	78.1%	turn 1–2	52.0%	26.1	−8.0	after Pengullet – Yearning for the after Elphidran Aqua – Gentle Ripp Pengullet – Yearning for the Sky –
Pump-Action Shotgun ◇7	4x	**turn 4–5**	55.4%	turn 3	30.5%	24.9	+22.1	after Cattiva – My First Pal −20.8 after Pengullet – Yearning for the
Jormuntide – Surging Sea Serpent ◇8	4x	**turn 3**	80.0%	turn 1–2	61.8%	18.2	−12.5	—
Kitsun – Wyrmbane Fangs ◇5	4x	**turn 4–5**	60.2%	turn 1–2	48.2%	12.0	+5.6	—
Single-Shot Rifle ◇4	2x	**turn 4–5**	62.0%	turn 1–2	50.4%	11.5	+6.7	—
Reindrix – Icy Gaze ◇5	4x	**turn 4–5**	60.6%	turn 1–2	50.5%	10.1	+10.8	—
Pengullet – Yearning for the Sky ◇4	4x	**turn 1–2**	66.5%	turn 3	58.9%	7.6	−5.7	Chillet – Dragon Whisperer +22.2 Pump-Action Shotgun −18.4 after Chillet – Dragon Whisperer –
Foxparks – A Toasty Hug ◇4	4x	**turn 1–2**	62.8%	turn 3	55.5%	7.3	+9.0	—
Fuack – Manic Wave Ripper ◇2	4x	**turn 4–5**	65.5%	turn 3	58.6%	7.0	−1.7	Pump-Action Shotgun −10.5
Blazehowl – Hellflame Defender ◇7	2x	timing made no difference				–	+6.7	—
Axel's Strategy ◇4	2x	timing made no difference				–	+6.9	—
Elphidran Aqua – Gentle Ripples ◇6	4x	timing made no difference				–	−9.5	Chillet – Dragon Whisperer +19.2
Lamball – My First Pal ◇2	4x	timing made no difference				–	−1.6	Chillet – Dragon Whisperer +11.0
Cattiva – My First Pal ◇2	4x	timing made no difference				–	−1.7	Chillet – Dragon Whisperer +9.7 Pump-Action Shotgun −20.8

> **Pump-Action Shotgun, Kitsun, Single-Shot Rifle, Reindrix, Foxparks, Blazehowl, Axel's Strategy** show a large held-past-five gap. Before reading that as "hold them", check the cost: at ◇1 or ◇2 there is rarely a reason to decline the play, so the games where they stayed in hand are mostly games that had better things to do with the turn. At ◇5 and above the same number usually is about timing, and worth acting on.

The company column is the sequencing test above, from this card's side: a name alone is the card played *after* this one, "after X" is this card played second. A row reading *timing made no difference* is a real result — the landing turn did not separate — and is better said than filled in with a window three tenths of a point up.

DECK RESEARCH

How far behind is too far

These are not findings and they are deliberately not in the table above. Where the life totals sat early predicts the result enormously well and tells you nothing you can act on, because it is the scoreboard, not a decision. What it does measure is something real about this particular list: whether it has a way back.

POSITION	WINRATE FROM THERE	GAMES
Still on 10 life at turn 3	72.8%	5,441
Down to 7 life or less by turn 3	40.5%	1,932
Opponent down to 7 or less by turn 3	71.7%	5,926
Three or more life ahead at turn 5	77.6%	4,239
Three or more life behind at turn 5	19.6%	1,010

At 40.5% the deck has a genuine way back from behind, so an early deficit is a position to play out rather than a loss to concede.

DECK RESEARCH

Conditions that change each other

Two conditions can each be worth five points and be worth five together, or fifteen. These are the pairs where the whole is not the sum: the winrate with both present, against each one holding on its own with the other absent. A pair is only listed when it clears *both* of its halves, which is a much harder bar than a large difference — otherwise the list fills with the stronger half restated with extra words.

BOTH CONDITIONS	TOGETHER	FIRST ONLY	SECOND ONLY	OVER THE BETTER HALF	GAMES
Reindrix by turn 3, then Pump-Action Shotgun within two turns with Single-Shot Rifle down by turn 3	23.3%	43.7%	51.4%	−28.1	60
Pump-Action Shotgun down by turn 3 with Foxparks by turn 3, then Pump-Action Shotgun within two turns	20.7%	33.1%	48.2%	−27.5	164
Reindrix by turn 3, then Pump-Action Shotgun within two turns with Chillet down by turn 2	26.6%	45.6%	53.6%	−27.0	169
Pump-Action Shotgun by turn 3, then Kitsun within two turns with Foxparks by turn 3, then Pump-Action Shotgun within two turns	18.3%	36.3%	44.7%	−26.3	60
Reindrix by turn 3, then Pump-Action Shotgun within two turns with Reindrix down by turn 2	34.1%	45.8%	59.0%	−24.9	293
Foxparks by turn 3, then Pump-Action Shotgun within two turns with Chillet down by turn 2	28.3%	45.0%	52.7%	−24.4	113
Pump-Action Shotgun by turn 3, then Jormuntide within two turns with Foxparks by turn 3, then Pump-Action Shotgun within two turns	21.0%	41.3%	45.1%	−24.1	81
Fuack by turn 3, then Pump-Action Shotgun within two turns with Reindrix down by turn 2	30.1%	45.5%	53.0%	−22.9	93
On the play with No gear down by turn 4	86.5%	67.9%	58.8%	+18.5	3,294
Chillet down by turn 2 with Elphidran Aqua still not down by turn 5	46.9%	57.7%	61.7%	−14.8	1,204

CORROBORATION

What 68 other players already do

The closest established archetype to this list overlaps it by **52%**. It has been played **1,193 times by 68 different people across 67 distinct lists**, at a **64.8% winrate**. Where that consensus differs from your list is the highest-prior edit there is — which is why it was the first candidate tuning tried.

YOUR LIST RUNS

~~2x ◇7 Blazehowl — Hellflame Defender~~
~~2x ◇4 Axel's Strategy~~
~~2x ◇4 Single-Shot Rifle~~
4x ◇2 Lamball – My First Pal (they run 2)
~~4x ◇8 Jormuntide — Surging Sea Serpent~~
~~4x ◇6 Elphidran Aqua — Gentle Ripples~~

THE CONSENSUS RUNS

4x ◇7 Relaxaurus – Hungry Gunner
4x ◇6 Azurobe – Water Dragon Waltz
4x ◇3 Sparkit – Hazardous Contact
4x ◇4 Elphidran – Gentle Radiance

What this does not claim

- **No mulligans.** The simulator's opening sequence was not enabled, so no game included a mulligan. A player dealt a bad opener can throw it back; the simulated deck is stuck with it. Opening-hand penalties here are upper bounds.
- **One pilot.** Every game was played by forge-2 on both sides. A deck that rewards lines this network does not find will be undersold. Candidate comparisons are insulated — identical pilot, identical

field, same batch — but the absolute numbers are "under this bot", not "under perfect play".

- **Comparable to which other runs.** This run was played by pipeline `7866b63172a1` on checkpoint `cef9992dc7d2`. A checkpoint name is not enough to identify a bot: the same checkpoint has played differently after a change to the card vocabulary or to what the policy is shown of a position, neither of which touches the file. Two reports carrying the same pipeline line can be compared directly. Two carrying different ones cannot — the gap between them is partly the bot, and nothing in either report can separate how much.
- **Conditional splits are correlational.** The opening analysis conditions on what the deck did, not on a randomised assignment. The mechanism is partly draw luck, not purely a decision you control at the table.
